RPPM LED

Innovative Visual Display & Mounting Solutions

RP Visual Solutions (RPV) presents three new ways to mount LED based displays. The new LED-specific mount types include: **X-Arm, Flex Mount, and Swing Mount.** All of these mounts feature front access for display serviceability.

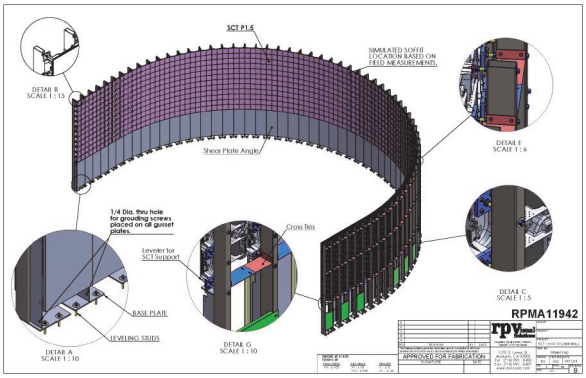
The **X-Arm Mount** is our most popular for front service. This mount extends forward for rear access. Linear Motion actuators can be added to automate the opening and closing of large walls.

The **Flex Mount** extends out from the wall up to 34”, allowing a technician or end- user to physically get behind the mount for cable connecting and other maintenance. The mount articulates left and right to enhance the viewing experience and for ease of installation and service.

For the tightest possible seams—the LED **Swing Mount** is ideal. This custom mount swings open and offers 6-axis adjustability to dial in each display to the most exacting specs.

Construction

RPMM LED Mounts are CNC laser cut from precision formed black powdercoat welded steel. The backer frame is constructed from 1.75” tube steel, allowing for a Jbox and source devices to be located within the framework.



It features pre-threaded holes providing the exact location of where each swing mount should be installed, saving valuable installation and service time. The 6-Axis swing is constructed from tube steel and has amble space for cable management and ventilation.
